

# 200 RS

**Engineered for performance**  
*Performing when you need it most*

## Better by Design

Derailments often happen in extremely difficult and challenging locations. That is why Cranemasters has spent more than a decade engineering and developing a crane for maximum performance and versatility for these situations. With 100 tons of lifting capacity, a telescopic boom, variable track widths, and a recovery winch rated at 140,000 pounds, Cranemasters is uniquely prepared for almost any situation.

**800-624-0543**  
**cranemasters.com**

With its telescopic boom, this crane and our highly trained professionals can put you back on track.

## Adjustable Track Width

Single main or double main. Either location is easily accessible with adjustable, padded tracks extend from an outside width of 11' 8" to a maximum width of 17' 4". The padded tracks help to minimize impact, while the addition of swamp mats increases the protection. The ability to vary track width independently also maximizes lifting capability by allowing the crane to shift its position side to side while leaving the tracks stationary.

The Dynamic envelope is very advantageous in tunnels. The 200 RS with its lifting ability in a confined space coupled with a forward or backward positionable recovery winch is the most efficient piece of equipment in the industry when it comes to tunnels.

## Water Recovery

Transition from land to water is very possible with our equipment. By loading cranes on spud barges, we are able to retrieve train cars and equipment from lakes, rivers and creeks.
