Tank Car Savers

Decades of working derailments combined with our innovative approach to service has led to an array of specialty equipment. As is often the case with technology, breakthroughs in one area lead to new possibilities in others. The 200RS not only changed the possibilities for handling derailments generally, but allowed for innovations in equipment for safely lifting and controlling tank cars in the field.

Our patented Tank Car Savers attach to the car by locking in a rigid configuration and positioning the lifting point directly above the car while only contacting the bolsters at the car's strongest points. This system allows cars to be controlled empty or loaded, even if the car is leaning and without causing additional damage to the cars. Preventing additional damage to tank cars can more than offset the cost of the derailment response.
